 New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.
 The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide, or least 80% sequence identity to a sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (1) an isolated nucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein; (b) at least 80% sequence identity to a

The invention relates to a human secreted and transmembrane polypeptide (PRO) and the polynucleotide encoding it. The PRO polypeptide or polynucleotide is useful in pharmaceuticals, diagnostics, biosensors bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atheroselerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs,
 New secreted and transmembrane polypeptides (e.g. PRO241, for use in pharmaceuticals, diagnostics or bioreactors, particularly for detecting or treating e.g. cancers, infertility or acquired immunodeficiency syndrome in mammals.
industry; cytostatic; antiinflammatory; cardiant; antiinfertility; anti-HIV; antiarteriosclerotic; antidiabetic.

 The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynuclectides encoding them. The invention also relates to a method for stimulating the release of tumour necrosis factor alpha (TNR-alpha) from human blood by contacting the blood with a sequence of the invention, a method for stimulating the
 nucleic acids encoding PRO polypeptides, useful a medicament for diagnosing or treating tumor.

Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal. Claim 11; Fig 34; 707pp; English The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane), sequences 80% identical to them, or encoding a PRO polypeptide lacking its associated signal peptide or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide. Also included are the encoded PRO proteins, PRO expression vectors; host cells transformed with the vector (used to

 produce PRO proteins), a chimaeric molecule comprising the PRO
polypeptide fused to a heterologous amino acid sequence, an anti-PRO
antibody, a method for stimulating the release of tumor necrosis factor
alpha (TNR-alpha) from human blood (by contacting the blood with PRO1079,
PRO827, PRO791, PRO1131, PRO1316, PRO1183, PRO1343, PRO1760, PRO1567 or
PRO4331), a method for stimulating the proliferation or differentiation
of chondrocyte cells by contacting the cells with a PRO6029 polypeptide,
a method for detecting the presence of tumour in a mammal and an
oligomuclectide probe derived from any of the nuclectide sequences cited
above. The PRO polypeptide or anti-PRO antibody is useful for preparing a
condition that is responsive to the PRO
polypeptide or anti-PRO antibody. The PRO nuclectide sequences are useful
complement for treating a condition that is responsive to the PRO
polypeptide or anti-PRO antibody. The PRO nuclectide sequences are useful
complements and DNA. PRO nucleic acids are also useful in preparing propoptides, in assays to identify other proteins or molecules involved
antisense RNA and DNA. PRO nucleic acids are also useful in transpentically useful reagence for canneals or knockout
animals, which in turn are useful in the development and screening of
therapeutically useful reagence of a tumour in a mammal, simulating
proliferation or differentiation of chondrocyte cells, stimulating
curlease of tumour necrosis factor-alpha from human blood, in gene
chergy, or as molecular weight markers for protein electrophoresis
culture or natural sources. The present sequence represents a PRO protein

 Three hundred and five nucleic acids encoding secreted and transmembrane RNO polypeptides, useful for the diagnosis, prevention and/or treatment of tumors, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumors.
 The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane). Methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of tumours, such as adenal, lung, colon, breast, prostate, rectal, cervical or liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human CDNA, genomic DNA or mRNA. The PRO genes amy also be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a human PRO polypeptide of the invention

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, or for preparing a medicament for treating a condition
 TCEAIGKPOPVMVTWVRVDDEMPOHAVLSGPNLFINNLNKTDNGTYRCEASNIVGKAHSD 323
 YMLYVYDPPTTIPPPTTTTTTTTTTTTLTILTITDSRAGEEGSIRAVDHAVIGGVVAVVV 385
 The invention relates to human PRO secreted/transmembrane polypeptides (ABR78227-ABR78531) and nucleic acids encoding them (ACF00100-00404). The invention also relates to sequences at least 80% identical to the PRO nucleic acid back cells comprising a PRO nucleic acid, a method for the recombinant production of a PRO polypeptide, and fusion proteins comprising a PRO nucleic acid, a method for the recombinant production of a PRO polypeptide, antibodies against a PRO polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially identified via homology screening using consensus sequences based on the extracellular domain sequences from known secreted proteins. Human cDNA libraries containing sequences of interest were identified using oligonuclectides based on the consensus sequences, and cDNA clones were isolated and characterised. The PRO polypeptides are useful for

Claim 12; Fig 24; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/ transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polymucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by culturing the host cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence and an antibody which specifically binds

to PRO. The PRO nucleotide sequences are useful as hybridisation probes, in chromosome and gene mapping, in generating sense and antisense RNA or DNA, in generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents, and in gene therapy. The polypeptides may be used as molecular weight markers for protein electrophoresis purposes. The PRO polypeptides and nucleic acids may also be used for chromosome identification, and tissue typing. PRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange syndrome. Other PRO proteins are variously implicated in immune disorders, inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, cardiac injury, AIDS, cancer and diabetic complications. The present sequence represents

 New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic
 The invention describes a novel isolated PRO polypeptide. The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein

v secreted and transmembrane PRO polypeptides and nucleic acids, useful
gene therapy, chromosome identification, tissue typing, for detecting
presence of tumor in a mammal, or as hybridization probes in gene

# Claim 11; Fig 34; 707pp; English

The invention describes a novel isolated PRO polypeptide. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nuclectide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically

```
useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of tumour in a mammal, stimulating proliferation or differentiation of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene therapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide

This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HIV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics,
 New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides, with or without their associated signal peptide. Also disclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNR-alpha) from human blood by contacting the blood with a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide, a method for detecting the presence of a tumour in a mammal and an oligonucleotide sequences are useful as probes, in chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as molecular weight markers for protein electrophoresis purposes, for chromosome identification, as chromosome markers, as therapeutic agents, for stimulating the presence of TNF-alpha from human blood, for stimulating the presence, prevention and/or treatment of a tumour, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour. The PRO polypeptides and nucleic acids may also be used disapnostically for the sequence data for this patent can also be betained to invention. Note: The sequence data for this patent can also be betained to in electronic format directly from USPTO at

ø New secreted and transmembrane PRO polypeptide useful in preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody.

## Claim 11; Fig 34; 707pp; English.

The invention relates to human PRO secreted/transmembrane polypeptides (ABR6963-ABR70267) and nucleic acids encoding them (ACC90994-ACC91298).

The invention also relates to sequences at least 80% identical to the PRO nucleic acid and polypeptide sequences of the invention, recombinant production of a RNO polypeptide, and though for the recombinant production of a RNO polypeptide, and though for the invention were initially polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially incleived and host centain using consensus sequences based on the extracellular domain sequences from known secreted proteins. Human cDNA libraries containing sequences of interest were identified using consensus sequences, and cDNA clones were isolated and characterised. The PRO polypeptides are useful for stimulating release of tumour necrosis factor—alpha (TNF-alpha) from chanced TNR-alpha release would be beneficial. They are also useful for chanced TNR-alpha release would be beneficial. They are also useful for stimulating the proliferation or differentiation of chondrocytes and as

 cuch may be used in the treatment of various bone and/or cartilage
disorders such as arthritis and sports injuries. The PRO polypeptides may
be used in a method for detecting the presence of a tumour (e.g., an
adrenal tumour, lung tumour, colon tumour, breast tumour, prostate
tumour, rectal tumour, cervical tumour or liver tumour) in a mammal. This
cumethod involves comparing the level of expression of the PRO polypeptide
in test and control samples, where a higher level of expression of PRO
conditionally useful for in drug screening to identify agonists and
antagonists of PRO polypeptides. PRO nucleic acids are useful as
contagonists of PRO polypeptides. PRO nucleic acids are useful as
contagonists of PRO polypeptides of attisense RNA and DNA and in gene
therapy. The nucleic acids can also be used for mapping genes encoding
contagonists, for genetic analysis of individuals with genetic
disorders, and for generating either transgenic animals or knock-out
animals which are useful in the development and screening of
therapy the nucleic acids can also be used for mapping genes encoding
contagonists and for generating either transgenic animals or knock-out
animals which are useful in the development and screening of
the respectionally useful compounds. Sequences ABR6963-ABR70267 represent
the human PRO secreted/transmembrane polypeptides of the invention. Note:
The sequence data for this patent is also available in electronic format
contagonists.

### (GETH ) GENENTECH INC.

Baker KP, Chen J, Desnoyers L, Goddard A, Godowski PJ, Gurney AL; Pan J, Smith V, Watanabe CK, Wood WI, Zhang Z;

#### WPI; 2003-341328/32. N-PSDB; ACD06949.

Three hundred and five nucleic acids encoding secreted and transmembrane by/peptides, designated as PRO, useful for detecting the presence of, or treating tumor, e.g. adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumor.

## Claim 11; Fig 34; 707pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the polymuclectides encoding them. The invention also relates to an antibody that specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis actor alpha (TWF-alpha) from human blood by contacting the blood with a PRO polypeptide and a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the blood with a PRO polypeptide. The polypeptides and polymucleotides are useful for detecting the presence of a tumour, such as an adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour, and for treating such tumours. The polymucleotides are useful as hybridisation probes, in chromosome and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. Both are useful in tissue typing. Sequences AB001437-AB001741 represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html

 ö
 -!- FUNCTION: Transcription factor. Interacts specifically with the W box (5'-(T)TGAC(C/T)-3'), a frequently occurring elicitor-responsive cis-acting element (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (Probable).
-!- SIMILARITY: Belongs to the WRKY group I family.
-!- SIMILARITY: Contains 2 WRKY domains.

"Molecular cloning of an 1-aminocyclopropane-1-carboxylate synthase from senescing carnation flower petals.";
Plant Mol. Biol. 18:37-38(1992).
-!- FUNCTION: Catalyzes the formation of 1-aminocyclopropane-1-carboxylate, a direct precursor of ethylene in higher plants.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine = 1-aminocyclopropane-1-carboxylate + methylthioadenosine.
-!- COFACTOR: Pyridoxal phosphate.
 Gaps
 -!- SIMILARITY: Belongs to the class-I pyridoxal-phosphate-dependent

cells and displays homology to adhesion molecules, B7-1 and cytoplasmic cells and displays homology to adhesion molecules, B7-1 and cytoplasmic region of B7-L1. Mouse LDCAM is found on Mynole embryo, testes, triple negative cells murine splanic and lymph node CD8+, S49.1 and dendritic cells. LDCAM polypeptides interacts with T cell surface molecules to alter signalling and inhibits T cell proliferation, bind to themselves and B7L-1, an LDCAM binding protein and increases natural killer (NK) cell populations. It may be used to measure the biological activity and as quality control reagents of LDCAM binding proteins. LDCAM may be used for treating disorders associated with malfunctioning of immune system, inflammation, autoimmune disorders, viral infected cells, infectious diseases and for killing tumour cells. They are also useful for prevention or reducing the effect of organ and bone marrow transplant crejection and for modulating T cell immune responses. LDCAM polypeptides may also be used as carriers for delivering agents attached to T cells or cells bearing B7L-1

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA80606A80623 encode the 12 secreted protein sequences given in AAA80606A80623 encode the 12 secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the cativities of the proteins include: immunosuppressant; anti-inflammatory; antiarthritic; antirhemmatic, dermaclogical; antiproliferative; antiarthritic; antirhemmatic, dermaclogical; antiproliferative; and antifungal activity. The proteins, polypeptides, agonists and antitude and conditions examples of which include: immune disorders e.g. disorders and conditions examples of which include: immune disorders e.g. Crohn's disease, rheumatoid arthritis, dermatitis, and multiple colon's disease, thenmatory disorders e.g. inflammatory bowel disease, crohn's disease, and nephritis; hyperproliferative disorders such as paraproteinaemias and purpura; cardiovascular disorders e.g. coronary atteniosclerosis and moptoratitis; canner e.g. melanoma and lymphoma. The proteins and polynucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene and the treatment of infectious diseases. The human secreted protein gene
 Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases.

 The invention relates to an isolated nucleic acid sequence, or its atalalist variant, a fragment of the cDNA sequence, or its fragment domain, epitope or species homologue. The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disasse. The present sequence represents the amino acid sequence of a novel human secreted protein.

 New polynucleotides encoding secreted human proteins, derived from adult placenta, adult retina, fetal brain, fetal.
The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

The present invention describes new human secreted proteins which were isolated from adult placenta, adult retina, foetal brain, foetal kidney, adult blood, adult brain, adult thyroid, adult blood, adult neural tissue, adult testes, and adult lymph node cDNA libraries. The human secreted proteins, and the polynucleotides encoding them, are predicted treating, preventing or ameliorating make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and call proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, cadherin/tumour ceptor/ligand activity, anti-inflammatory activity, cadherin/tumour incompassion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for gene therapy. AAX3316 to AAX3313 encode human secreted proteins, and AAX52998 to AAX5360 crepresent human secreted proteins, given in the present invention

The invention relates to an isolated nucleic acid comprising at least 10 contiguous nucleotides of any of the 233 polynucleotide sequences given in the specification, or its complement. The nucleic acids encode cancerassociated proteins. Also included are an expression vector comprising the isolated nucleic acid or expression vector, a microarray for detecting a cenominant nucleic acid or expression vector, a microarray for detecting a cancer-associated (CA) nucleic acid comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the 35 comprising at least 10 contiguous nucleotides of any of the 35 comprising at least 10 contiguous nucleotides of any of the 35 comprising frame of a CA sequence selected from any of the 35 complement), an isolated antibody, (or its antigen binding fragment) that an open reading trame of a CA sequence selected from any of the 35 complement), an isolated antibody, (or its antigen binding fragment) that binds to the above polypeptide, a hybridoma that produces the above complement), an isolated antibody, (or its antigen binding fragment) that conformal antibody, a pharmaceutical composition comprising the above antibody and a pharmaceutical composition of cancer cells in an individual, a method for inhibiting growth of cancer cells in an individual, an electronic library comprising the above conformation of a polypeptide in a test cell sample, a secreting cancer activity or fa CA protein (CAP), methods for detecting the expression of a sociated with expression of a polypeptide in a test cell sample, and antibod for training the activity of a CA protein (CAP), methods for a benefit method for training the expression of a polypeptide in a test cell sample, and and method for inhibiting and method for training the expression of a polypeptide in a test cell sample. CAP associated with expression of a polypeptide in a test cell sample of animar cell cancer and a method for treatenting and treating cancer and a method for prese

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention.

The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of detect the presence of a tumour in a mammal by comparing the level of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
 Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.

The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when comparated to any of 15 sequences, fully defined in the specification, lacking or with its associated signal peptide; or (b) at least 80% sequence of any of 15 sequence encoded by the full-length coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (l) an isolated mucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence comprising: (a) at least 80% sequence identity to a nucleotide sequence or full-length coding sequence with any of 15 fully defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a proposited under ATCC Accession No. 209526, 209528, 209527, 209538, 209530, 209531, 209530, 209531, 209530, 209531, 2
 New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.
 Human; PRO; secreted protein; transmembrane protein; anti-HIV; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; cardiant; AIDS; acquired immunodeficiency syndrome; cancer; atherosclerosis; inflammatory disease; diabetic complication; cardiac injury; organ failure.

cell comprising the vector which, when cultured under conditions suitabl for expression of the PRO polypeptide, produces the PRO protein; (4) a chimeric molecule comprising PRO fused to a heterologous amino acid sequence; and (5) an anti-PRO antibody. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS (acquired immunodeficiency syndrome), cancer, atherosclerosis, inflammatory disease, diabetic complications, cancer, autheroscierosis, inflammatory antibodies can also be used in the different screening, therapeutic and biological assays. The present sequence represents a PRO protein

12-70N-1998 16-70N-1998 16-70N-1998 17-70N-1998 17-70N-1998 17-70N-1998 22-70N-1998 23-70N-1998 he invention relates to a human secreted and transmembrane polypeptide (PRO) and the polynucleotide encoding it. The PRO polypeptide or polynucleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits. The sequences are also useful in biotechnological and medical research and in various polypeptides of the invention

 transmembrane polypeptides) and the PRO polymucloctides encoding them. The invention also relates to a method for stimulating the release of twing the ercrosis factor alpha (TNF alpha) from human blood by contacting the blood with a sequence of the invention, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide and a method for detecting the presence of a tumour in a mammal. The polypeptides and polymucleotides are useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. Sequences ABUSSSRA represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html

The invention relates to three hundred and five nucleic acids encoding CC RRO polypeptides (secreted and transmembrane), sequences 80% identical to them, or encoding a RRO polypeptide lacking its associated signal peptide cc are extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide. Also included are the encoded PRO proteins, PRO expression vectors, host cells transformed with the vector (used to produce PRO proteins), a chimaric molecule comprising the PRO proteins), a chimaric molecule comprising the PRO proteins), a chimaric molecule comprising the PRO proteins), a chimaric molecule comprising the PRO proteins), a method for stimulating the release of tumor necrosis factor alpha (TNP-alpha) from human blood (by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the prosence of tumour in a mammal and an oligonucleotide probe darived from any of the nucleotide sequences cited above. The PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful on bypeptides or anti-PRO antibody. The PRO nucleoted are also useful for turn are useful in the development and screening of therapeutically useful reagents, for chromosome admitication, and animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome cited are also useful for detecting the presence of a tumour in a mammal, arimulating the transgence byping. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of a tumour in a mammal, are useful contactors, and molecular weight markers for protein or differentiation or differentiation o
 Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal.

The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides. Also disclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood by contacting the blood a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation and the presence of a tumour in a mammal and an oligonucleotide probe derived from any of the PRO nucleotide sequences. The nucleotide sequences are useful as probes, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as chromosome identification, as chromosome markers, as therapeutic agents, for chromosome identification, as chromosome markers, as therapeutic agents, for stimulating the proliferation or differentiation of chondrocytes and electring the presence of a tumour. The PRO polypeptides and nucleic acids may also be used diagnostically for tissue typing. The sequences presented in ABUG7100 are the PRO polypeptides of the invention

 The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane). Methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of tumours, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human CDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a human PRO polypeptide of the invention

Human; PRO; secreted protein; transmembrane protein;

Human secreted polypeptide PRO355, SEQ ID NO:34.

(first entry)

ABR78243;

```
The invention relates to human PRO secreted/transmembrane polypeptides (ABRPOS17-ABRPOS13) and nucleic acids encoding them (ACPOINO-00404). The invention also relates to sequences at least 80% identical to the PRO invention also relates to sequences at least 80% identical to the PRO nucleic acid and polypeptide sequences of the invention, recombinant vectors and host cells comprising a PRO polypeptide. Mucleic comprising a PRO polypeptide in a PRO polypeptide in And fusion proteins comprising a PRO polypeptide. Mucleic colds encoding PRO polypeptides of the invention were initially intelled the colds and fusion proteins comprising a PRO polypeptide. Mucleic colds encoding PRO polypeptides of interest were identified via man colds and characterised. The PRO polypeptides are useful for invention with a proteins containing sequences from known secreted proteins. Human cDNA incleaded and characterised. The PRO polypeptides are useful for stimulating release be tumour necrosis factor-alpha (TNF-alpha) from man blood and may thus be used in the treatment of conditions in which change of the proliferation or differentiation or differentiation of propertides may be used in the treatment of various bone and/or cartilage such may be used in the treatment of various bone and/or cartilage such may be used in the treatment of various bone and/or cartilage such may be used in the treatment of various bone and/or cartilage used in the treatment of various bone and/or cartilage used in the treatment of various bone and/or cartilage which as attribrials and sports injuries. The PRO polypeptides may be used in the treatment of various bone and/or cartilage in the test samples, where a higher transport unmour, lung tumour, colon tumour, breast tumour, profetter tumour, profetter tumour, profetter tumour, profetter of the presence of a tumour of PRO polypeptides in the test samples, where a higher language of propeptides are and control samples, where a higher language of the presence of a tumour and propertion of PRO polypeptides
 New secreted and transmembrane PRO polypeptides and nucleic acids, usefuin gene therapy, or for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody.

The invention relates to an isolated nucleic acid encoding a secreted/
transmembrane polypeptide (designated as PRO proteins). 15 PRO
CC polypeptides and thair encoding polymuclectides are disclosed. Also
cincluded are a vector comprising the PRO nucleic acid, a host cell
comprising the vector, a process for producing a PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
polypeptide, and recovering the PRO polypeptide form the cell culture, an
isolated polypeptides a chimmaeric molecule comprising PRO fused to a
cherrologous amino acid sequence and an antibody which specifically binds
cc he PRO polypeptides, a chimmaeric molecule comprising PRO fused to a
cherrologous amino acid sequence and an antibody which specifically binds
cc herrologous amino acid sequence are useful as hybridisation probes,
in chromosome and gene mapping, in generating sense and antisense RNA or
DNA, in generating transgenic or knock-out animals which can be used in
the development and screening of therapeutically useful reagents, and in
cc gene therapy. The polypeptides may be used as molecular weight markers
cc for protein abscrophoresis purposes. The PRO polypeptide and nucleic
cacids may also be used for chromosome identification, and tissue typing.
PRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange
cc syndrome. Other PRO proteins are variously implicated in immune
cd isorders, inflammatory disease, organ failure, atherosclerosis, cardiac
injury, infertility, birth defects, premature aging, cardiac
injury, infertility, borth defects, premature aging, cardiac
injury, and contents and diabetic complications. The present sequence represents

 SAAALIPTGDGQNLFTKDVTVIEGEVATISCQVNKSDDSVIQLLNPNRQTIYFRDFRPLK 91
The invention describes a novel isolated PRO polypeptide. The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, chromosome identification, tissue typing, for detecting the presence of tumor in a mammal, or as hybridization probes in gene mapping.
 The invention describes a novel isolated PRO polypeptide. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA DNA. PRO nucleic acide are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding

 reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of tumour in a mammal, stimulating proliferation or defection of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene therapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide

|                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                              |

```
This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HIV, cytostatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, of diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA probes, in the polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a protein encoded by the nucleic acids of the

 DEC-
The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides, with or without their associated signal competition. Also disclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNR-alpha) from human blood by contacting the blood with a CRO polypeptide, a method for stimulating the proliferation or differentiation of chodrocyte cells by contacting the blood with a PRO contactine a method for detecting the presence of a tumour in a mammal an oligonucleotide probe derived from any of the PRO nucleotide con an oligonucleotide probe derived from any of the PRO nucleotide and gene mapping, in generating antiense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as concented and gene method as differentiation electrophoresis purposes, for creplacement of defective gene). The PRO polypeptides are useful as concented identification, as chromosome markers, as therapeutic agents, for stimulating the proliferation or differentiation of chondrocytes and detecting the presence, prevention and/or treatment of a tumour, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour. The PRO polypeptides and nucleic acids may also be used diagnostically for in electronic format directly from USPTO at this patent can also be betained concented by an encaperation betained and and an encape of the concented by an encape of the concented by an encape of the concented by an encape by and processing the proliferation or differentiation or dispense of the concented by any and directly from USPTO at this patent can also be betained and an encape because by the proliferation by the proliferation by the proliferation by the proliferation or dispense by the proliferation by the proliferation or dispense by the proliferation or dispense by the proliferation or dispense by the proliferation

adrenal tumour, lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour, cervical tumour or liver tumour) in a mammal. This method involves comparing the level of expression of the PRO polypeptide in test and control samples, where a higher level of expression of PRO polypeptide in the test sample as compared to the control sample is indicative of the presence of a tumour. The PRO polypeptides are additionally useful for in drug screening to identify agonists and antagonists of PRO polypeptides. PRO nucleic acids are useful as hybridistation probes (for isolation of cDNA molecules), in chromosome and gene mapping, in the generation of antisense RNA and in gene therapy. The nucleic acids can also be used for mapping genes encoding
 ABR69963-ABR70267) and nucleic acids encoding them (ACC90994-ACC91298). The invention also relates to sequences at least 80% identical to the PRO
 stimulating the proliferation or differentiation of chondrocytes and as such may be used in the treatment of various bone and/or cartilage disorders such as arthritis and sports injuries. The PRO polypeptides may be used in a method for detecting the presence of a tumour (e.g., an
 nucleic acid and polypeptide sequences of the invention, recombinant vectors and host cells comprising a PRO nucleic acid, a method for the recombinant production of a PRO polypeptide, antibodice against a PRO polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially identified via homology screening using consensus sequences based on the extracellular domain sequences of interest were identified using oligonucleotides based on the consensus sequences, and cDNA clones were isolated and characterised. The PRO polypeptides are useful for stimulating release of tumour necrosis factor-alpha (TNR-alpha) from human blood and may thus be used in the treatment of conditions in which enhanced TNR-alpha release would be beneficial. They are also useful for the human blood and may thus be used in the treatment of conditions in which enhanced TNR-alpha release would be beneficial. They are also useful for the human blood and may thus be used in the treatment of conditions in which enhanced TNR-alpha release would be beneficial.
 therapeutically useful compounds. Sequences ABR69963-ABR70267 represent the human PRO secreted/transmembrane polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html
 invention relates to human PRO secreted/transmembrane polypeptides
 Gurney AL;
 PRO polypeptides, for genetic analysis of individuals with genetic disorders, and for generating either transgenic animals or knock-out animals which are useful in the development and screening of
 ಥ
 New secreted and transmembrane PRO polypeptide useful in preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody.

transmembrane polypeptides on antibody that specifically binds to a PRO invention also relates to an antibody that specifically binds to a PRO polypeptide a method for stimulating the release of tumour necrosis factor alpha (TMF-alpha) from human blood by contacting the blood with a PRO polypeptide and a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide. The polypeptides and polynucleotides are useful for detecting the presence of a tumour, such as an adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour, and for treating such tumours. The polynucleotides are useful as hybridisation probes, in chromosome and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful in tissue typing. Sequences ABOO1431.

Colypeptides are useful in tissue typing. Sequences ABOO1431.

ABOO1741 represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from
 Three hundred and five nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO, useful for detecting the presence of, or treating tumor, e.g. adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumor.
 Godowski PJ, Gurney AL;
 The invention relates to human PRO polypeptides (secreted and

1076.191 Million cell updates/sec
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
